

# Calibration of Hybrid Simulation Procedure

Emel Seyhan and Jonathan P. Stewart  
*University of California, Los Angeles*

Robert W. Graves  
*USGS, Pasadena, CA*

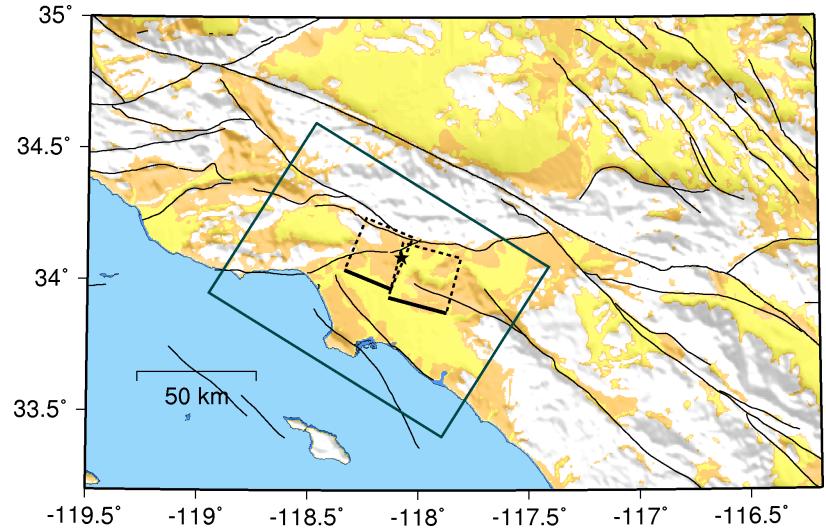

TSRP Coordination Meeting  
August 11, 2010  
Davis Hall, Berkeley

# Outline

- Hybrid simulation procedure
- Problems with existing procedure
  - Distance attenuation
  - Standard deviation
- Present study
  - Distance attenuation calibration
  - Intra-event scatter calibration

# Motivation

- Broadband motions for response history analysis
- Some (M, R) ranges poorly sampled by recordings
- Motions needed with

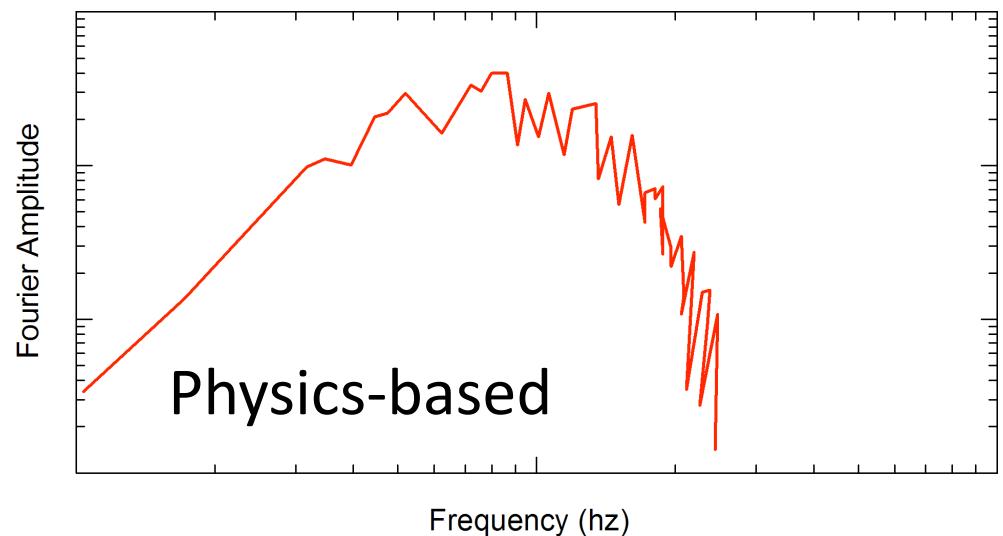

Simulations hold potential to provide useful ground motions for engineering application in these situations

- Near fault effects

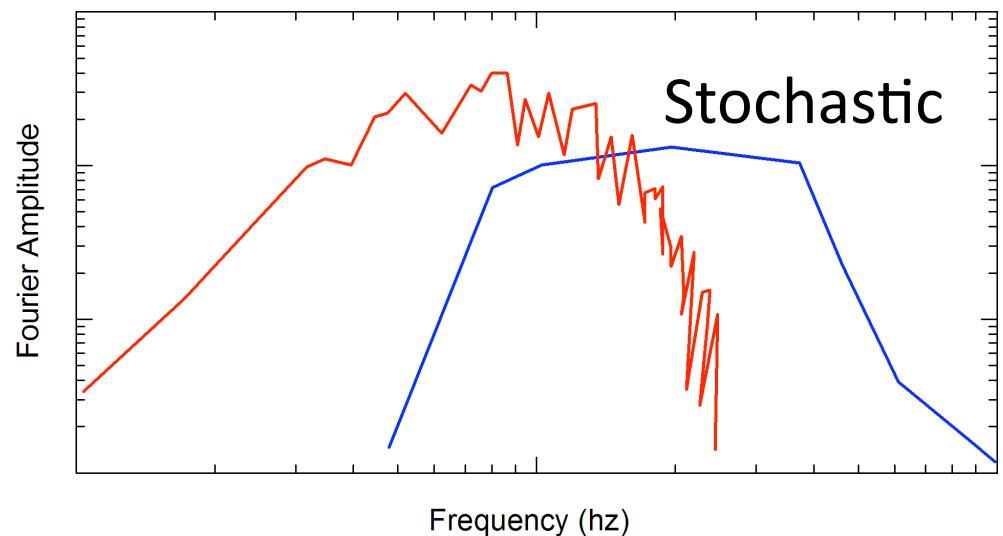

# Simulation Procedure

- Hybrid procedure
  - $f < 1 \text{ Hz}$ : physics based

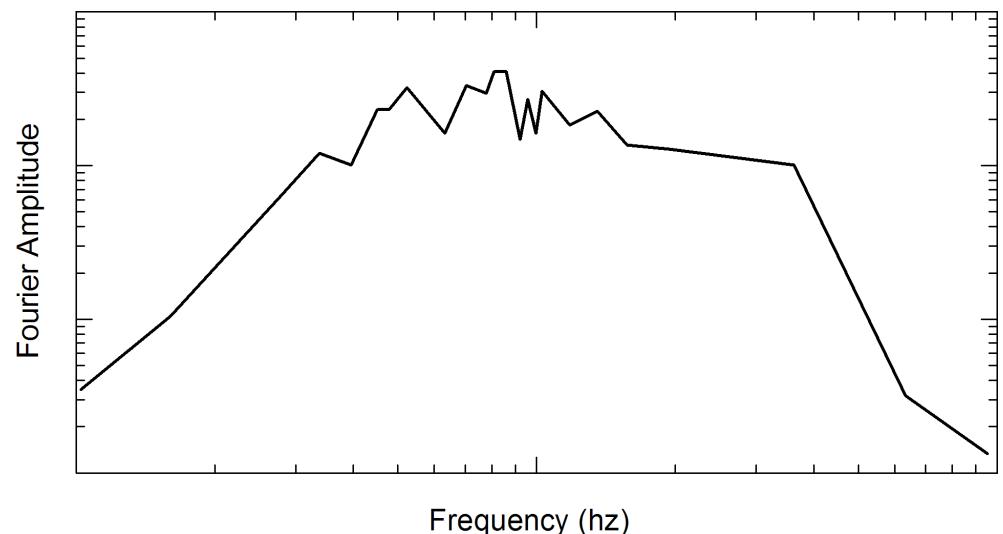

# Simulation Procedure

- Hybrid procedure
  - $f < 1$  Hz: physics based
  - $f > 1$  Hz: stochastic

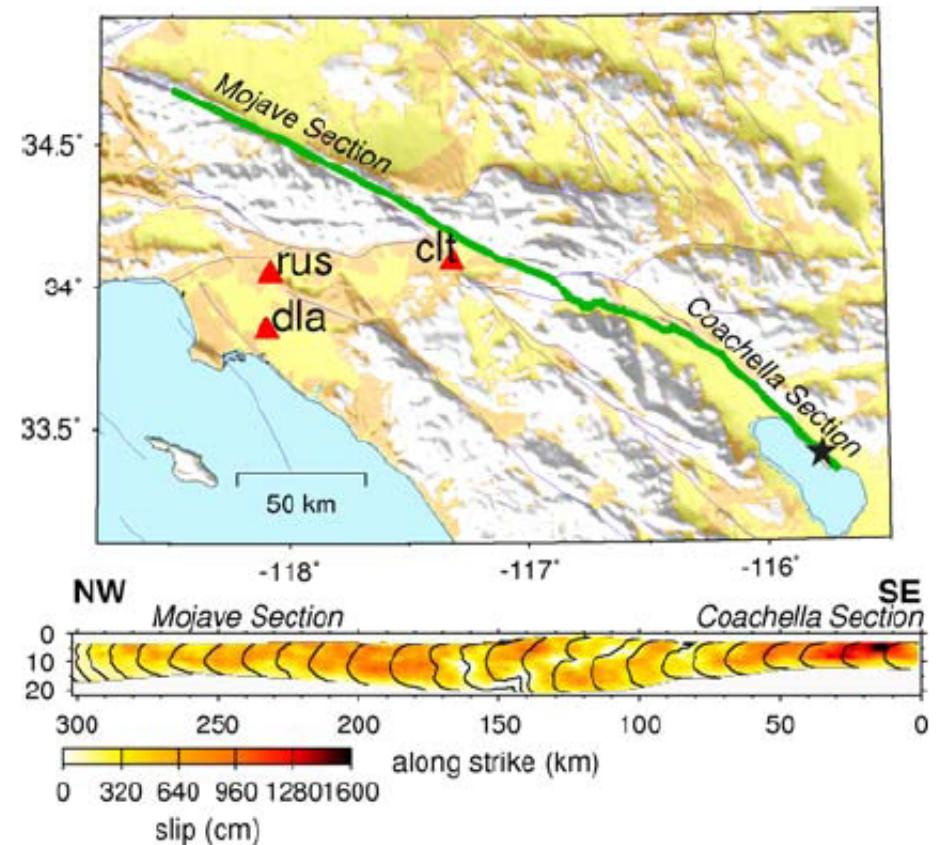

# Simulation Procedure

- Hybrid procedure
  - $f < 1$  Hz: physics based
  - $f > 1$  Hz: stochastic

# Simulation Procedure

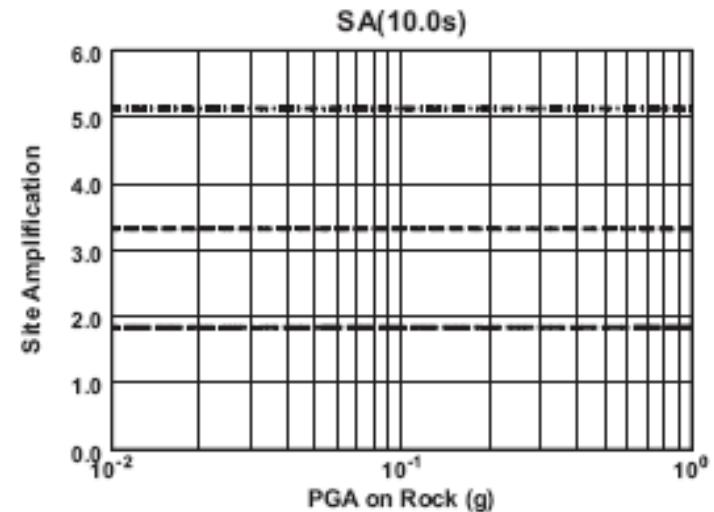

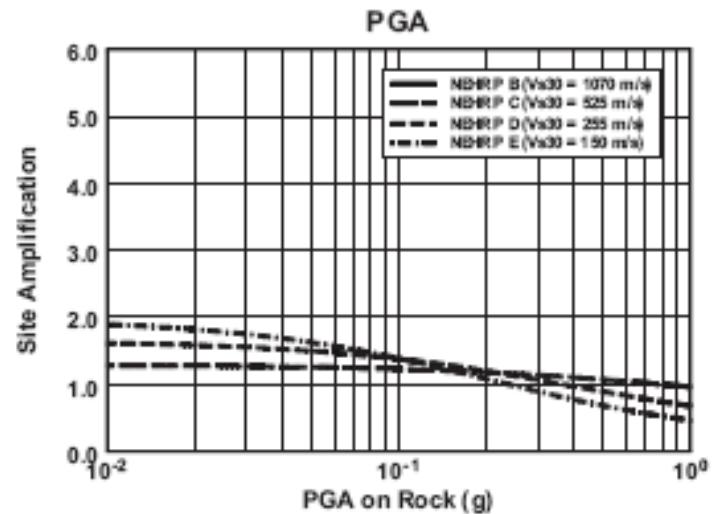

- Hybrid procedure
- Source function
  - Slip distribution
  - Rupture velocity

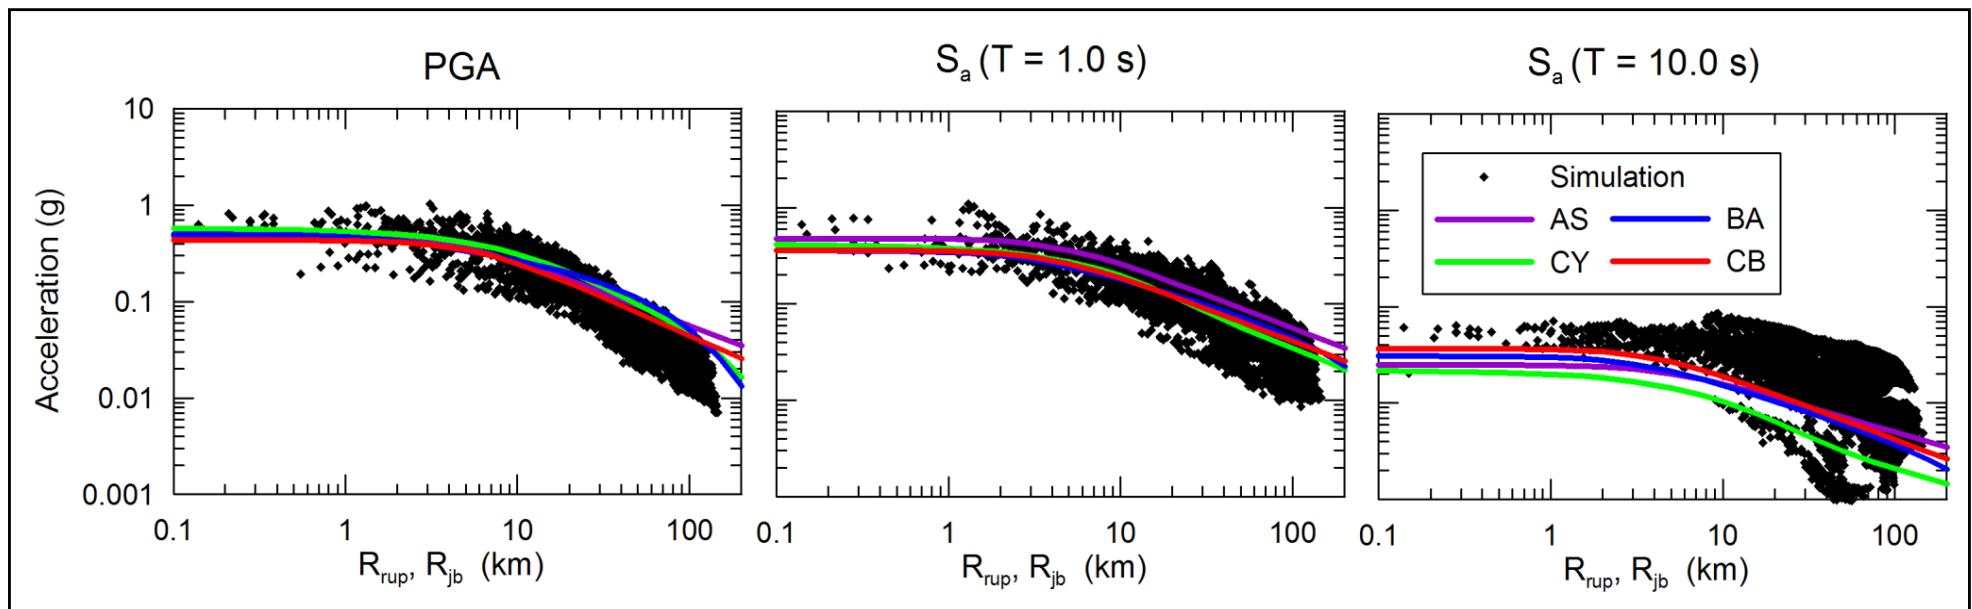

Shakeout,  $M_w$  7.8

# Simulation Procedure

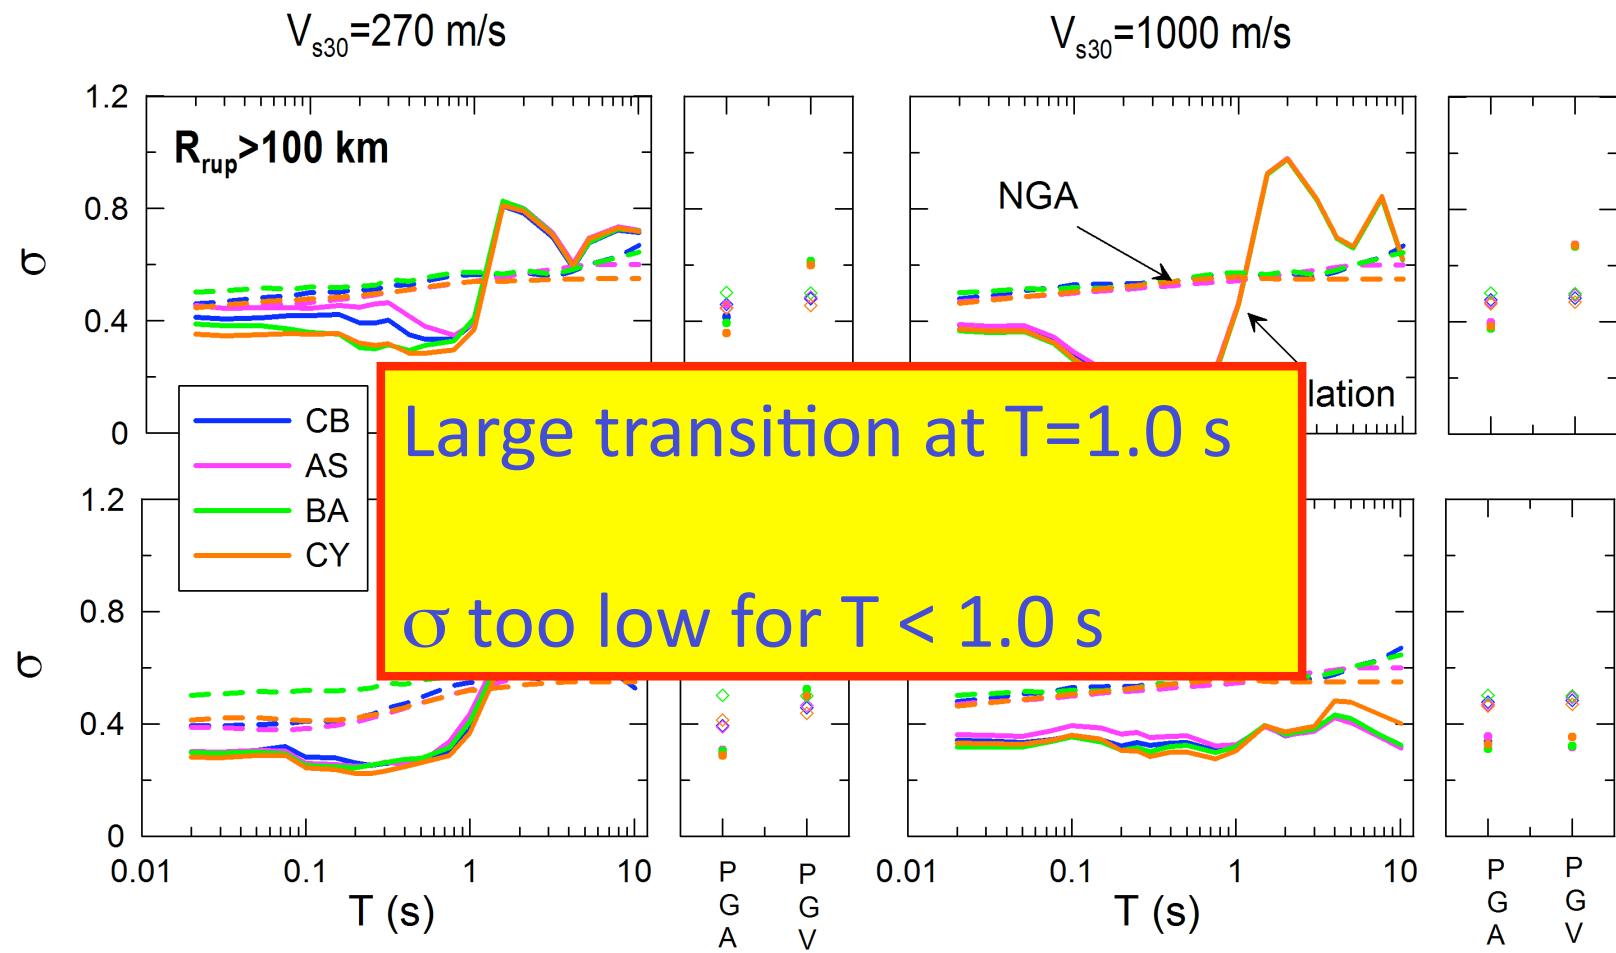

- Hybrid procedure
- Source function
- Semi-empirical site term (fn of  $V_{s30}$ )

# Distance Attenuation

# Standard Deviation

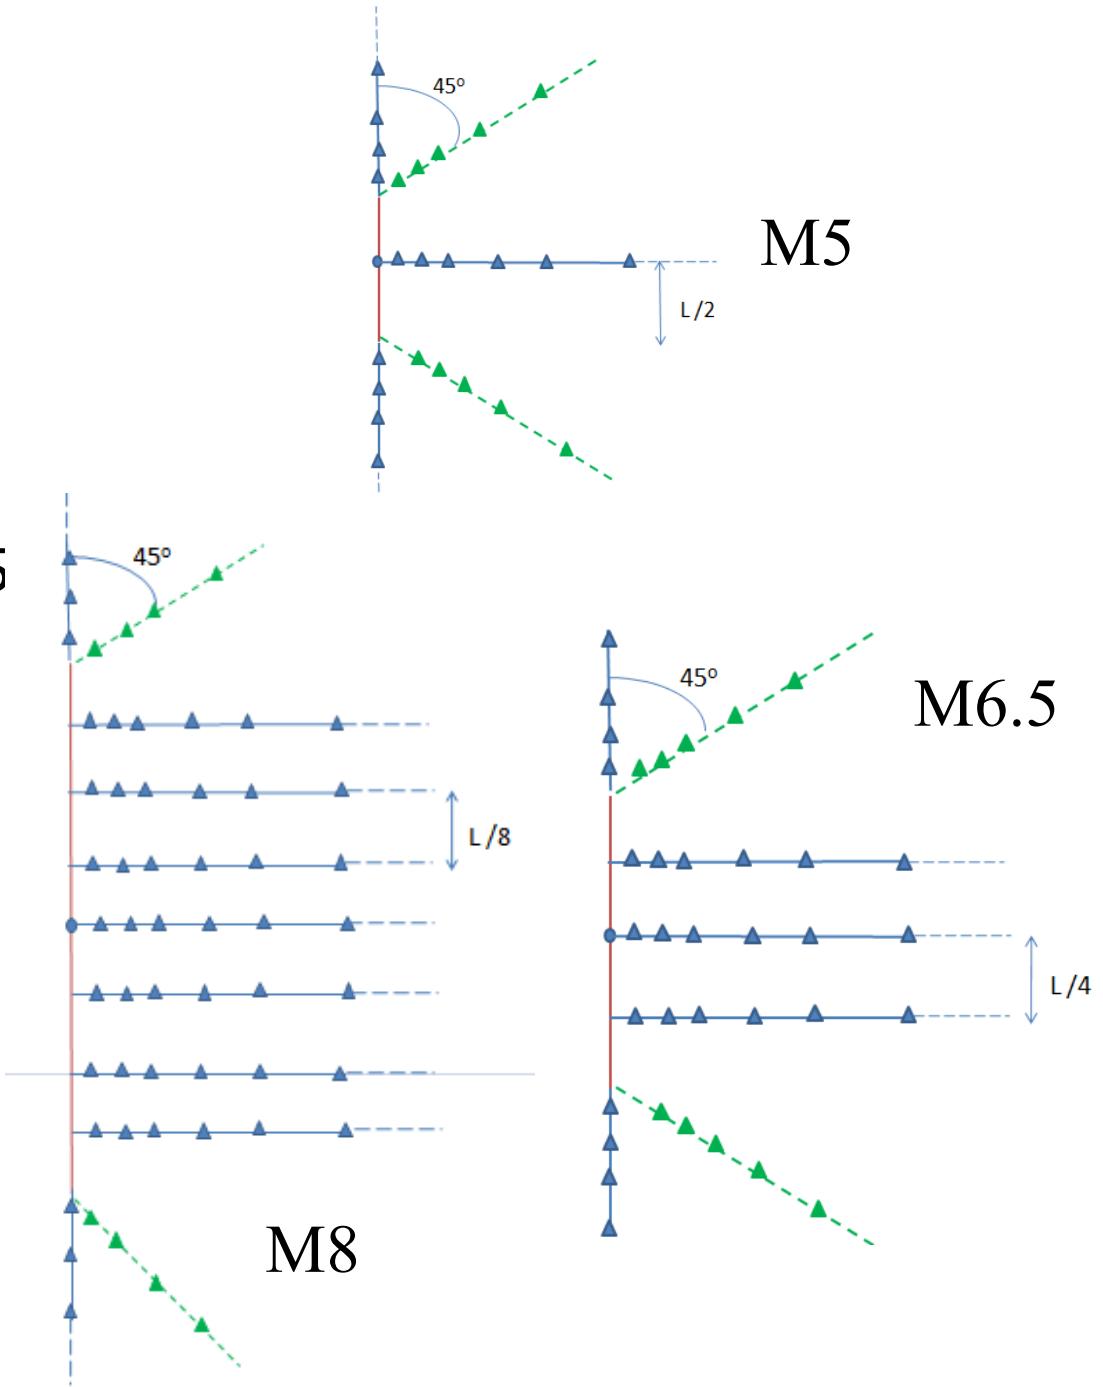

$$\sigma = \text{stddev}(\varepsilon)$$

# Present Study

- Focus on high frequency stochastic model
- Parameters affecting stochastic model
  - Source parameters: Stress drop, slip function, rise time, rupture velocity
  - Path parameters: Distance, crustal damping ( $Q$ )
  - Site parameters: Crustal velocity, shallow site term
- We select  $Q$  as the parameter for modification for the distance attenuation
- We plan to randomize crustal velocity to increase the sigma

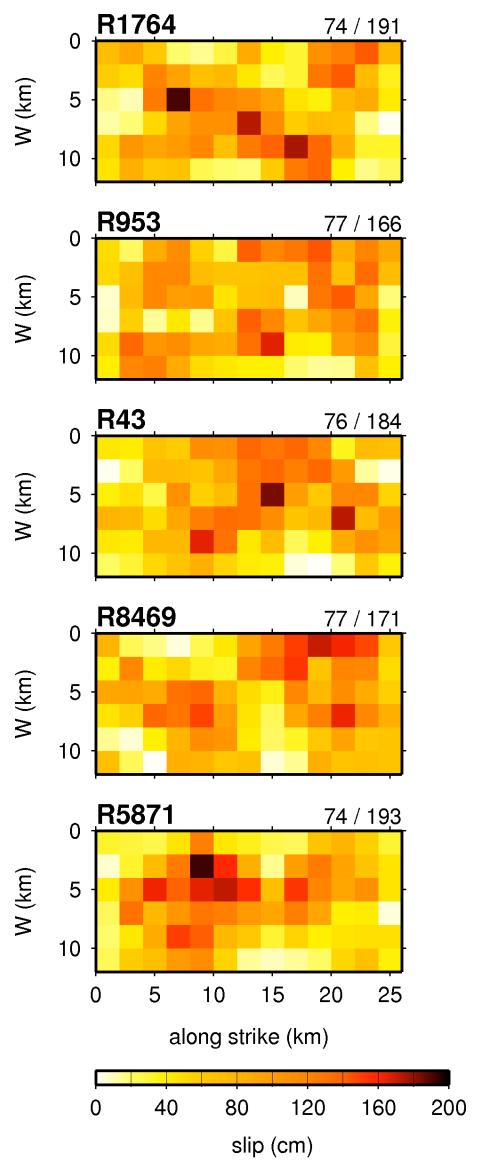

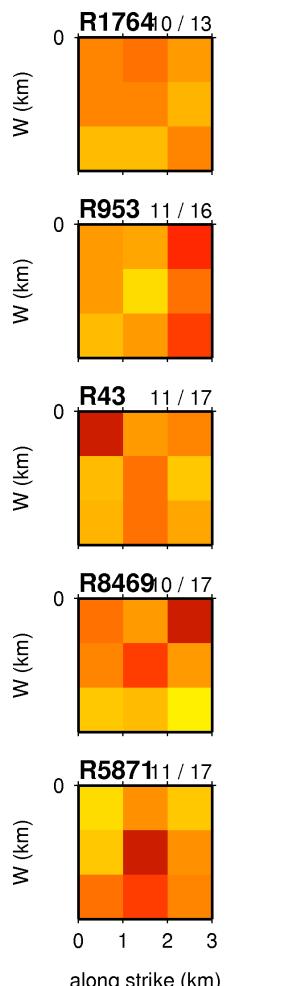

# Scope

- Distance attenuation calibration
  - Strike slip fault M5, 6.5 and 8
  - Distributed arrays

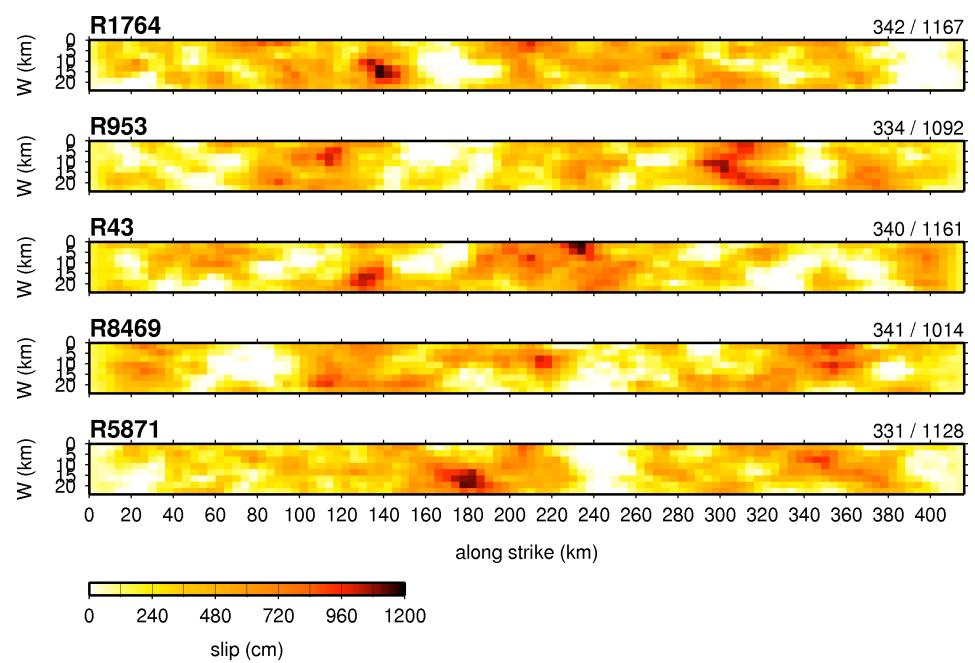

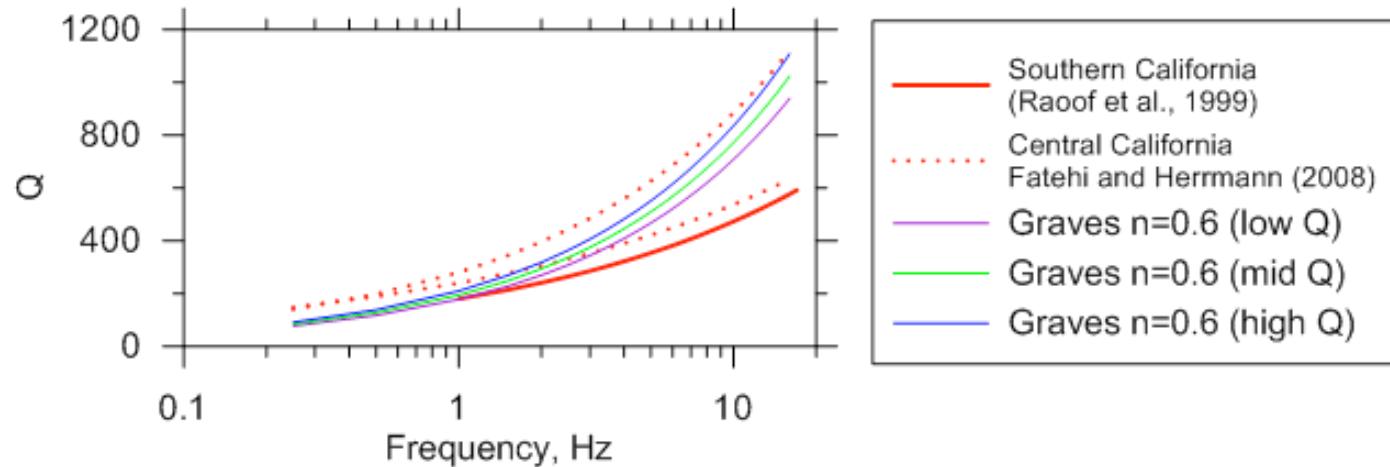

# M6.5

## M5

# M8

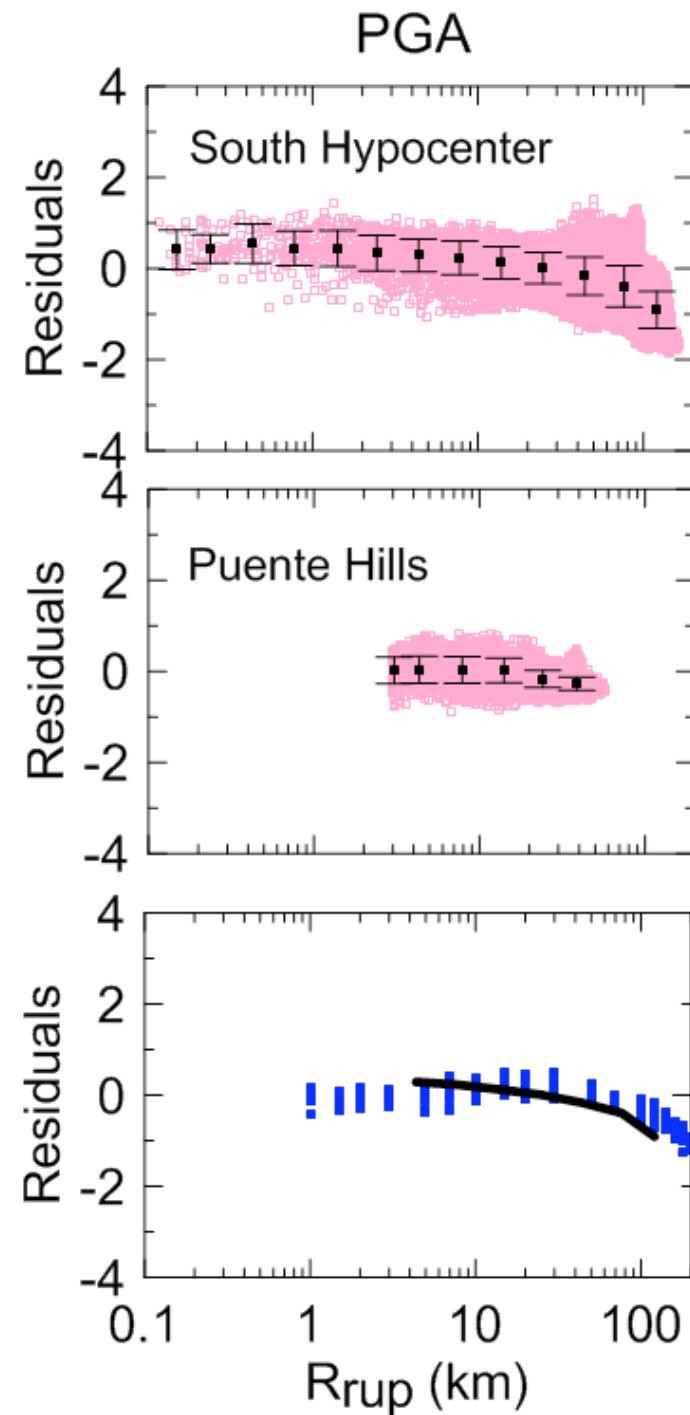

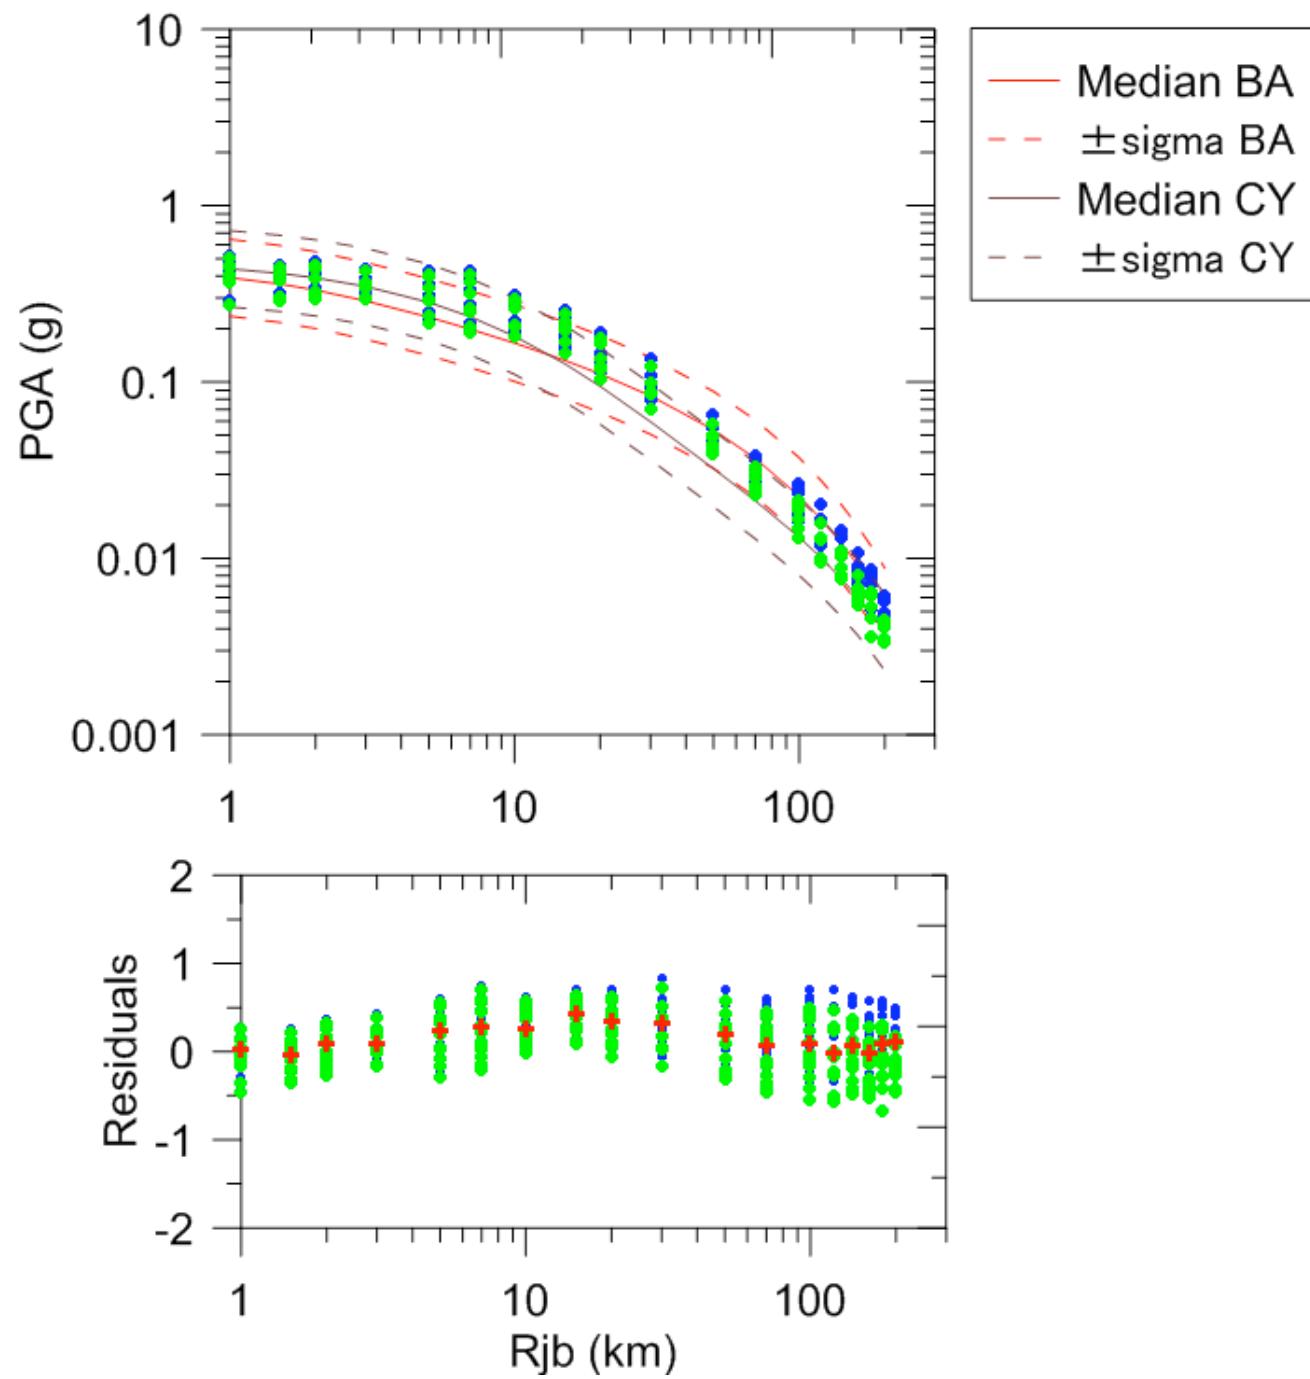

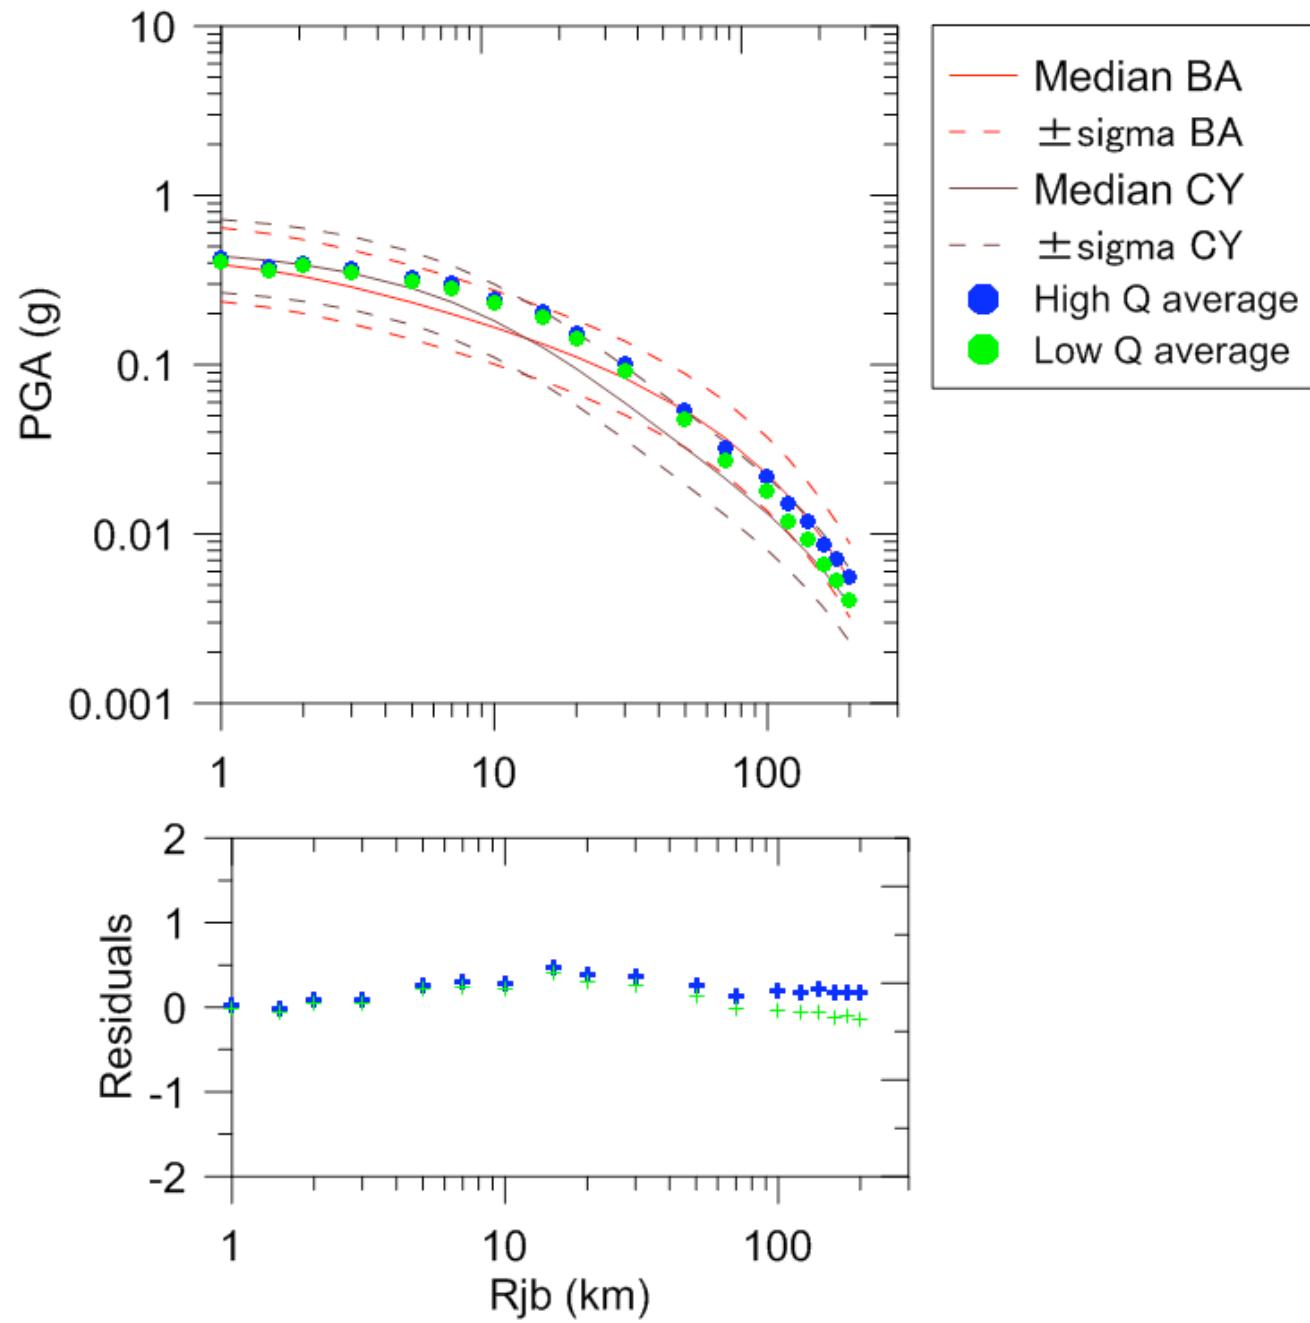

- Distance attenuation calibration
  - Strike slip fault, M 5, 6.5, 8
  - Distributed and dense arrays
  - Repeat Hybid sim. for various levels of crustal damping, Q

$$Q(f) = Q_0 * f^n$$

$$Q_0 = a + bV_s$$

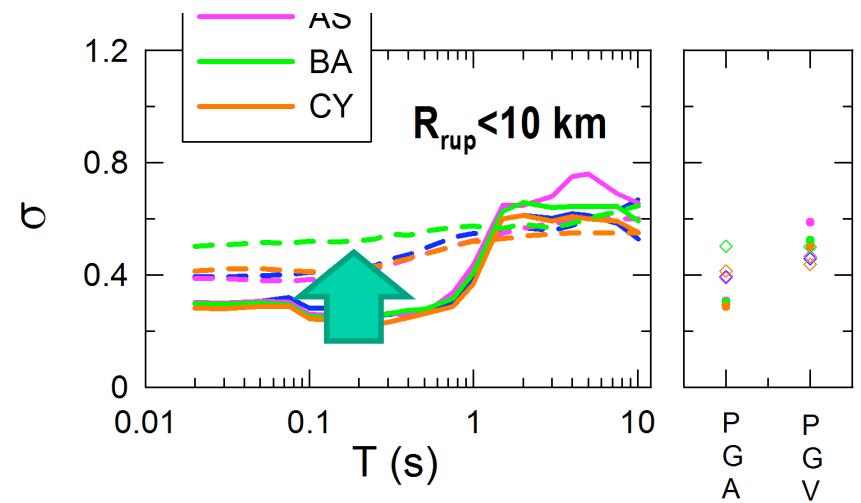

# Scope

- Distance attenuation calibration
- Intra-event scatter calibration
  - Randomized velocity
  - Randomized Fourier Amplitude
  - Randomized Q

# Summary of Work

## Completed Work

- Distance attenuation calibration
  - Source model selected
  - Magnitude 6.5 simulations completed
  - The critical parameter for calibration identified (Q)

## Remaining Work

- Distance attenuation calibration
  - Simulations for M5, M8
- Intra event scatter calibration

Thank you !
