8m in 2 events

An aerial photograph showing a wide, green valley. A river flows from the top left towards the center, then turns right. In the lower left, a small, bright blue lake is visible. The terrain is covered in dense green vegetation and scattered evergreen trees. The overall scene is a natural, undisturbed landscape.

Eastern, unruptured (02), Denali

**Bean Lake, Tetlin River
20 km east of Totschunda fault intersection**

Denali Rupture Characteristics

Rupture of multiple faults: connectivity

Slip distribution asymmetric: D_{max} 180 km east of epicenter

Slip divided into distinct sections (4-9) of D_{avg}

Large changes in slip occur over short (≤ 400 m) distances

Within distinct sections point-specific D can vary by 90%

Rupture structurally simple except at bends and steps

Width of fault zone typically narrow (1-5m); no correlation between width of zone and D_{net}

Paleo offsets similar in size to 2002

D_{avg} (8 m) at surface
Characteristic slip

Bulnay Rupture Characteristics

Rupture of multiple faults: connectivity

Slip distribution asymmetric: D_{max} 170 km east of epicenter

Similar amount of slip over long distances (≥ 200 km)

Rupture commonly complex; multiple traces 0.1-1.0 km apart

Complexity may reflect long recurrence ($\sim 3ka$)

Paleo offsets similar in size to 1905
